Snapshot of October 29, 2026. This dossier describes the four repositories as they stood that day; the projects have moved on since, and the repositories are the authority. Underlined links lead to the sources, frozen at their state of that day.

PUBLIC DOCUMENTATION · GNU6DOTLIVE

Four projects, explained without jargon

This dossier tells the story of four public repositories — three under a free licence, the fourth with no licence decided yet: a Linux desktop, a local artificial-intelligence lab, a package manager and a scene engine. No advertising, no promises: what exists, what is proven, and what is still open.

THE DESKTOP

gnosix

A complete desktop environment, written in Rust, that draws its own bar, its application deck, its settings and its lock screen. It runs on Linux, with the Hyprland compositor.

EXPERIMENTAL · 26.11-RC1 « ARDOISE »

THE ENGINE

gnostral.rs

A research lab trying to run large AI models on a modest graphics card — and publishing its measurements, including when they disappoint.

RESEARCH · V0.8.0

THE COMPANION

Calix

A single native window to install, update and inventory the software of an Arch Linux system — without hiding where each package comes from.

PRE-1.0 V0.3.1

THE SCENE

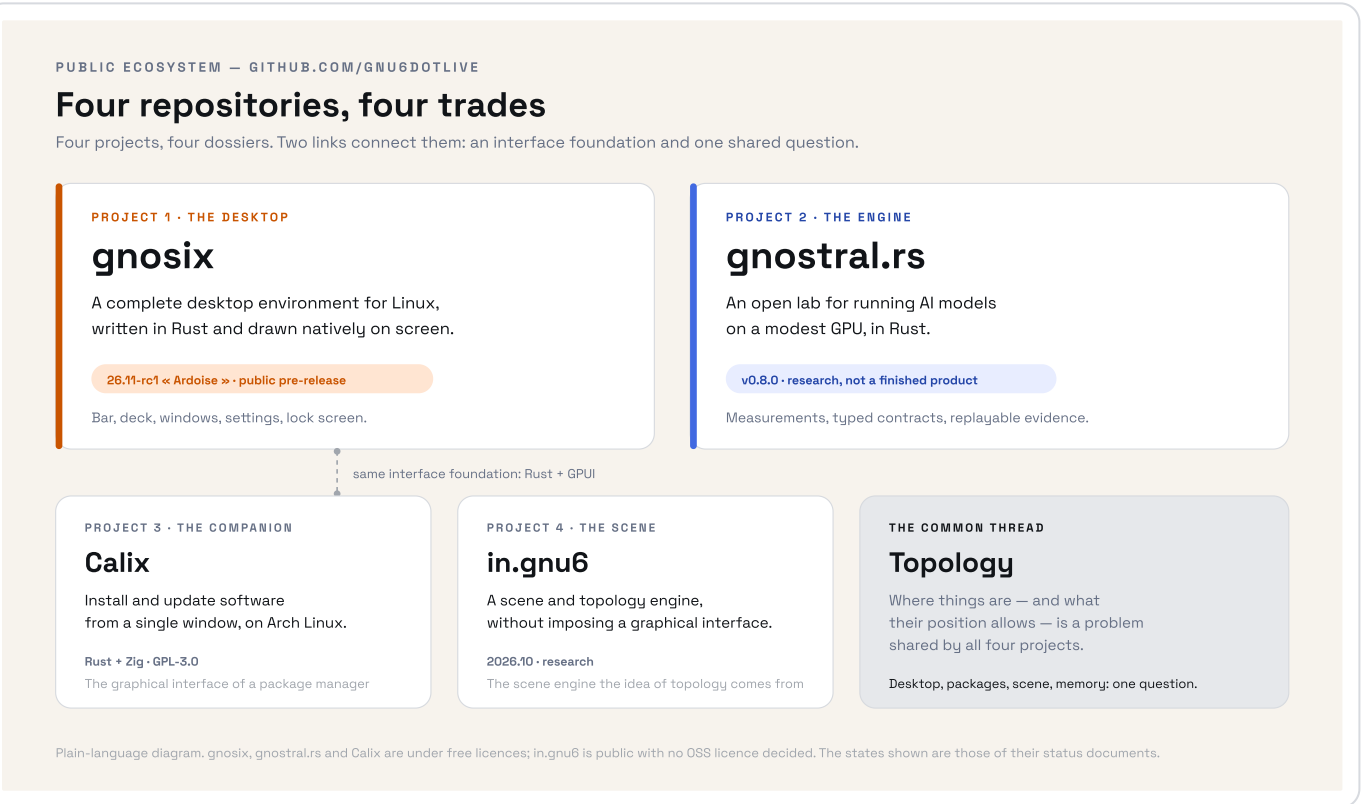

in.gnu6

A scene and topology engine: it decides what exists; the displays only decide how to show it.

RESEARCH 2026.10.0

Four repositories, four trades

Four projects, four different trades, and one dossier for each: **gnosix** builds a visible desktop, **gnostral.rs** runs measurable research, **Calix** keeps an Arch Linux system's software in order, **in.gnu6** provides the scene engine that serves as common ground.

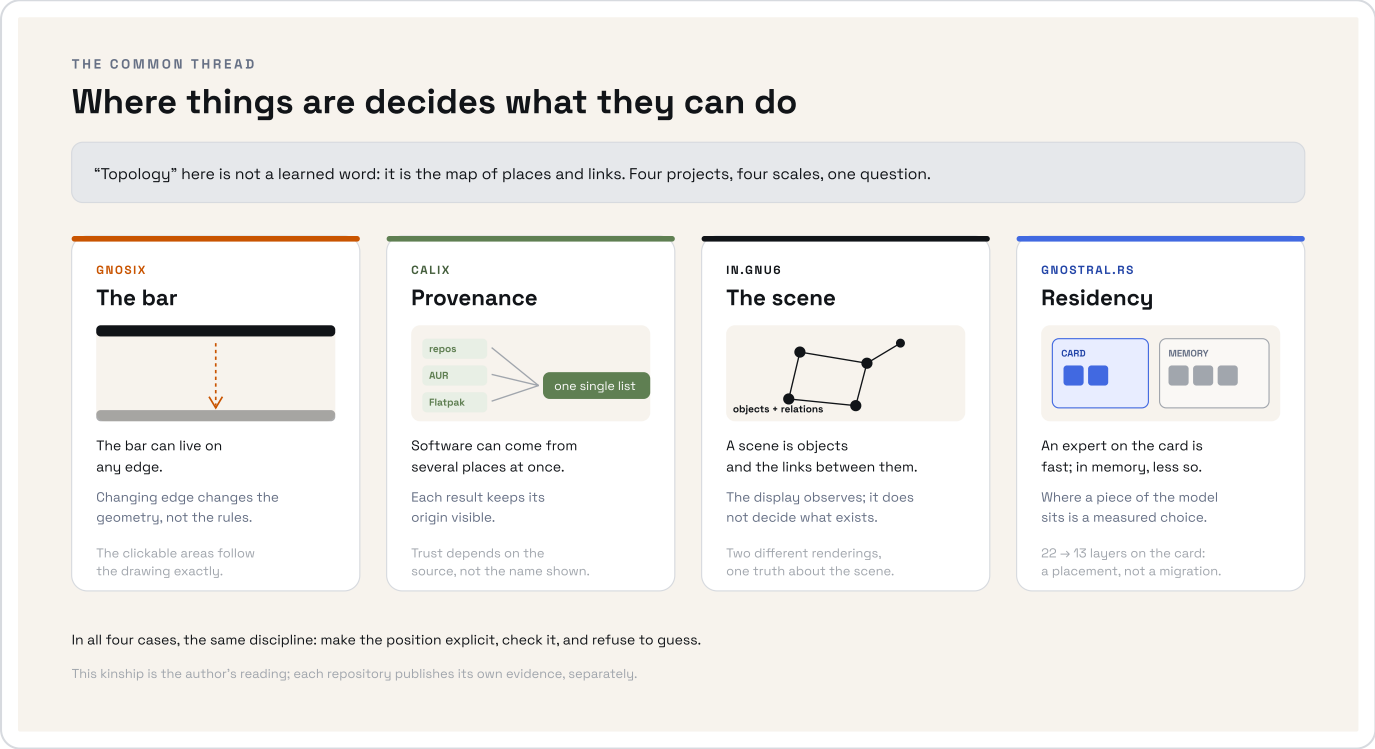

Reading the map. Four trades, two links: Calix shares gnosix's interface foundation (Rust and GPUI), and in.gnu6 carries the underlying question common to all four — topology. Each dossier has its own page.

The common thread: topology

The word sounds learned. It names something simple: **the map of places and links.** Where a thing is, what it is connected to, and what that position allows.

In gnosix, the bar can live on any edge of the screen; its position changes the geometry, not the rules. In Calix, a piece of software can come from several repositories; its origin stays visible. In in.gnu6, a scene is a set of objects and relations that the display does not decide. In gnostral.rs, a piece of a model placed on the graphics card runs faster than a piece left in main memory.

One discipline. Make the position explicit, check it, and refuse to guess. This kinship is the author's reading: each repository publishes its own evidence, separately.

Three principles for reading these repositories

1. Written is not proven

A file describing a feature does not prove it works. These projects explicitly separate written code, a passing test and real use.

2. A repository is not a product

A public repository is an open workshop. You can walk in, read, test — but nothing there is guaranteed installable, stable or supported.

3. Free does not mean finished

Open source makes the recipe visible and reusable. It promises neither quality, nor maintenance, nor a user manual for the general public.

What you will not find here

GOOD TO KNOW

No promise of stability. All four projects are explicitly experimental or research. gnosix is not yet a desktop ready for others; gnostral.rs is not a server ready to deploy; Calix is pre-1.0; in.gnu6 has neither an OSS licence nor a stable API.

No marketing figures. The published numbers come from local measurements, with their protocol and their limits. When a claim has not been proven, it is withdrawn or flagged as such.

That is precisely what makes these repositories worth reading: they also document what did not work.

Where to go next

DOSSIER 1

gnosix, the desktop

How a desktop draws itself, remembers, and never acts without permission.

DOSSIER 2

gnostral.rs, the engine

How a large model is made to fit on a small card, and how that is proven.

DOSSIER 3

Calix, the companion

How six sources of software become a single list, without erasing where they come from.

DOSSIER 4

in.gnu6, the scene

How an engine decides what exists, and lets the projectors decide the rest.

The technical words are translated in Glossary: the vocabulary.
